Outline

The calculus of string diagrams

Worked example: monoids

Our first diagrams

Our first diagrams

Here A is a set.

Our first diagrams

Here A and B are sets, and $f : A \to B$ is a function.

Compositions

Vertical composition $a \mapsto g(f(a))$:

Compositions

Vertical composition $a \mapsto g(f(a))$:

Horizontal composition $(a, b) \mapsto (f(a), g(b))$:

Rules

Multivalued functions

If $f : A \times B \to C \times D \times E$ then we can draw it like so:

More constructs

Crossing over $(a, b) \mapsto (b, a)$:

, satisfying:

More constructs

Duplicating elements $a \mapsto (a, a)$:

, satisfying:

More constructs

Deleting elements:

, satisfying:

Monoids

Definition

A monoid is a set M equipped with a multiplication $\mu : M \times M \to M$ (we write $\mu(a, b) = a * b$) and an element $e \in M$ called the identity satisfying:

- (associativity) for any $a, b, c \in M$, $a * (b * c) = (a * b) * c$,
- (identity) for any $a \in M$, $e * a = a = a * e$.

Monoids

Definition

A monoid is a set M equipped with a multiplication $\mu : M \times M \to M$ (we write $\mu(a, b) = a * b$) and an element $e \in M$ called the identity satisfying:

- (associativity) for any $a, b, c \in M$, $a * (b * c) = (a * b) * c$,
- (identity) for any $a \in M$, $e * a = a = a * e$.

Example

- The natural numbers under addition $(\mathbb{N}, +, 0)$
- The natural numbers under multiplication $(\mathbb{N}, *, 1)$
- Matrices under multiplication $(\mathrm{Mat}_n, *, I_n)$
- Strings under concatenation $(A^*, ||,)$

Monoids diagramatically

The map $\mu : M \times M \to M$ and element $e \in M$ satisfy:
Associativity:

Identity:

Product monoid

Let $(M, \mu, e), (M', \mu', e')$ be monoids. Define the product monoid, with set $M \times M'$ as follows.

Product monoid

Let $(M, \mu, e), (M', \mu', e')$ be monoids. Define the product monoid, with set $M \times M'$ as follows.
Identity:

Product monoid

Let $(M, \mu, e), (M', \mu', e')$ be monoids. Define the product monoid, with set $M \times M'$ as follows.
Identity:

Product monoid

Let $(M, \mu, e), (M', \mu', e')$ be monoids. Define the product monoid, with set $M \times M'$ as follows.

Monoid homomorphisms

Definition

Let $(M, \mu, e), (M', \mu', e')$ be monoids. A function $f : M \to M'$ is a monoid homomorphism if

- for any $a, b \in M$, $f(a * b) = f(a) *' f(b)$,
- and $f(e) = e'$.

Monoid homomorphisms

Definition

Let $(M, \mu, e), (M', \mu', e')$ be monoids. A function $f : M \to M'$ is a monoid homomorphism if

- for any $a, b \in M$, $f(a * b) = f(a) *' f(b)$,
- and $f(e) = e'$.

Example

- From $(\mathbb{N}, +, 0)$ to $(\mathbb{N}, *, 1)$, map $n \mapsto 2^n$.
- From $(\mathbb{R}, *, 0)$ to $(\mathrm{Mat}_n, *, I_n)$, map $x \mapsto xI_n$.
- From $(\mathbb{Z}_4, +, 0)$ to $(S^1, *, 1)$, send $n \mapsto e^{\frac{n\pi i}{2}}$.

Homomorphisms diagramatically

A function $f : M \to M'$ is a homomorphism if:

Is $f =$

a homomorphism? (Equationally, $f(m) = m^2$.)

Is $f =$

a homomorphism? (Equationally, $f(m) = m^2$.)
